

RAPID PREP

LARGE PORTABLE
HEPA AIR FILTRATION SYSTEMS

Up to 45,000 cfm of HEPA filtration on a trailer or skid

A standard portable HEPA air is about 1,000 cfm. Our units are 6,000 to 45,000 cfm and have long-life filters that in this application will last for years.

How It Works

- Unit can be parked outside the building
- Large 16" or 20" flexible ducting will run from the unit into the building
- Air flow created will capture any airborne pathogen
- Air will pass through the thousands of square feet of HEPA filtration in the unit and discharge the clean air outside
- Studies show the greater the airflow the chances of airborne pathogens infecting someone is greatly reduced
- Units can be diesel or electric powered and can run around the clock-no need to ever change filters

One units does the work of 28 standard
HEPA machines

Our long-life filters are designed for heavy dust loading, therefore being used as a HEPA negative air machine, the self-cleaning filters will last years.

With Rapid Preps five locations and our own trucking we can deliver to your location quickly.
