

RAPID PREP

BULK BLASTING SYSTEM

Rapid Prep's bulk units are designed to maximize safety and productivity while minimizing downtime and maintenance costs. These high productivity blasting systems feature multi-outlet Thompson Valve II controls that allow each operator independent control of the blast outlets. Hi-Flow Auto Air Valves are standard and the high production valve provides less air restriction than the 1½" auto air valve without increasing the piping size. These units are designed to provide the industry's lowest pressure drop, resulting in higher productivity.

- Safest industry design: features normally closed, fail-safe valves and controls
- Low maintenance design minimizes downtime
- Some units have full-load lifting eyes for easier transport (standard lift eyes not rated for steel abrasives)
- 10" camlock closure requires less maintenance and allows for faster filling of abrasive
- 12" x 16" manway for easy access
- 150 psi ASME code vessel
- Ladder allows easy access to closure
- Optional moisture separator for even abrasive flow
- Available as stationary or mounted on highway and yard trailers
