## VACUUM BLAST AND RECOVERY SYSTEMS

### *How Does It Work?*

When vacuum blasting, blasting is **sealed off** by a brush head, and dust and abrasives are immediately vacuumed by a powerful suction unit. Spent blasting grit, debris & dust is collected for **disposal**, or **abrasive recovery** processing for blast media recycling & reuse – to **reduce the waste** disposal of spent blasting abrasive. Our vacuum blasting units are a safe blasting solution for **confined or critical areas**.
